

Standardized Anomalies Associated with the 2009 Christmas Snowstorm

Jared Leighton
NWS Topeka

Barbara Mayes
NWS Omaha/Valley

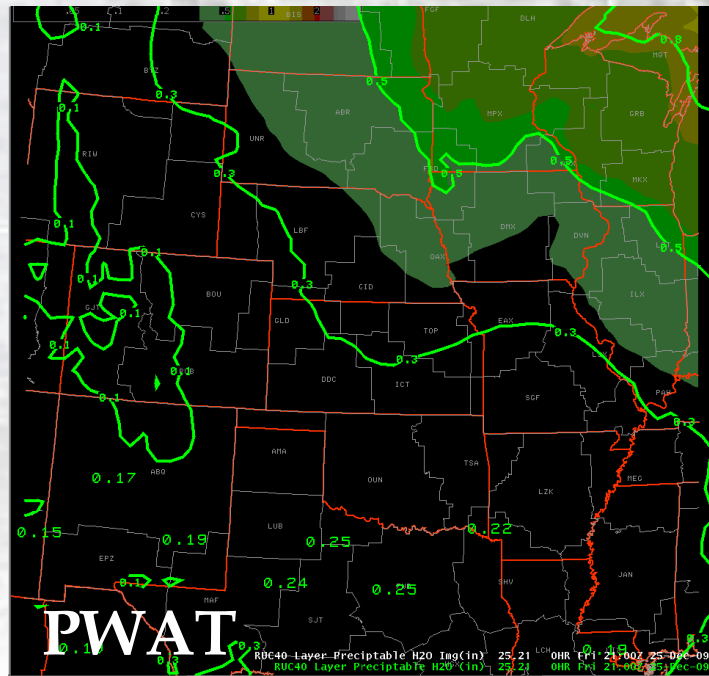

Event Recap

- **Event spanned roughly 00z 24 Dec through 18z 27 Dec 2009**
 - Stretched from North Texas northward to the Canadian border.
 - Affected: Oklahoma City, Tulsa, Topeka, Kansas City, Omaha, Sioux Falls, Minneapolis, and Duluth.
 - ❖ 9.8 million people (metro)
- **Heavy snow and strong wind for several hours**
 - 7 to 10 inches of snow across the Southern and Central Plains with 40 to 50 mph winds (peak gusts up to 68 mph in C. Oklahoma)
 - 15 to 25 inches of snow across Northern Plains. Winds still strong, but weaker than Southern Plains (gusts 25-40 mph – Rapid City 76 mph).
- **Christmas Holiday**
 - 78 million road travellers nationwide (AAA), untold number of cancelled flights
 - ❖ 21 fatalities (Oklahoma/Nebraska), Hundreds of injury accidents
 - Several million dollars in damages, cleanup costs, and lost commerce.

Event Evolution

00z 24 Dec - 00z 26 Dec 2009

Snowfall Dec 24 00z - Dec 27 18z

Peak Wind Dec 24 00z - Dec 27 18z

What is an Anomaly?

- Hart and Grumm 2001, Graham and Grumm 2010, Mayes et al. 2009
- Climatic Mean taken over a 30 year period (POR)
 - Mean is calculated from a running 21 day average
 - NARR data taken over a 32 km grid (1978-present)
 - ❖ Better temporal/spatial resolution
 - GR data taken over a 2.5° x 2.5° grid (1948-present)
- Departure from the mean divided by σ .
 - $N = (X - \mu) / \sigma$
 - ❖ $X =$ variable, $\mu =$ mean value, $\sigma = 1$ standard deviation
 - This eliminates seasonal and latitudinal variations.

- Determine: $M_{\text{wind}} + M_{\text{height}} + M_{\text{temp}} + M_{\text{Moisture}}$

$$M_{\text{var}} = \frac{N_{1000} + N_{925} + N_{850} + N_{700} + N_{600} + N_{500} + N_{400} + N_{300} + N_{250} + N_{200}}{n}$$

$$M_{\text{total}} = \frac{|M_{\text{wind}}| + |M_{\text{height}}| + |M_{\text{temp}}| + |M_{\text{Moisture}}|}{n}$$

Anomaly Caveats

- **Not all anomalies are created equal**
 - Some anomalous systems moderate an otherwise extreme situation
 - ❖ Ex: Anomalously high temperatures in January vs. Anomalously low temperatures in January
 - Overall anomaly (M_{total}) could be dominated by one variable
 - ❖ Strong ridge with less anomalous flow and moisture fields
 - Conversely, the overall anomaly of a significant system could be diminished by a single less consequential variable
 - ❖ Ex: Christmas Blizzard
 - Duration is not taken into account.
- **Future work could include classifying anomalies for better historical context**
 - Ranking by types of systems (snow storms, severe weather, heat waves, etc...)
 - ❖ Many systems contain more than one “type” of weather.

Strongest Departures since 1948

Central U.S.

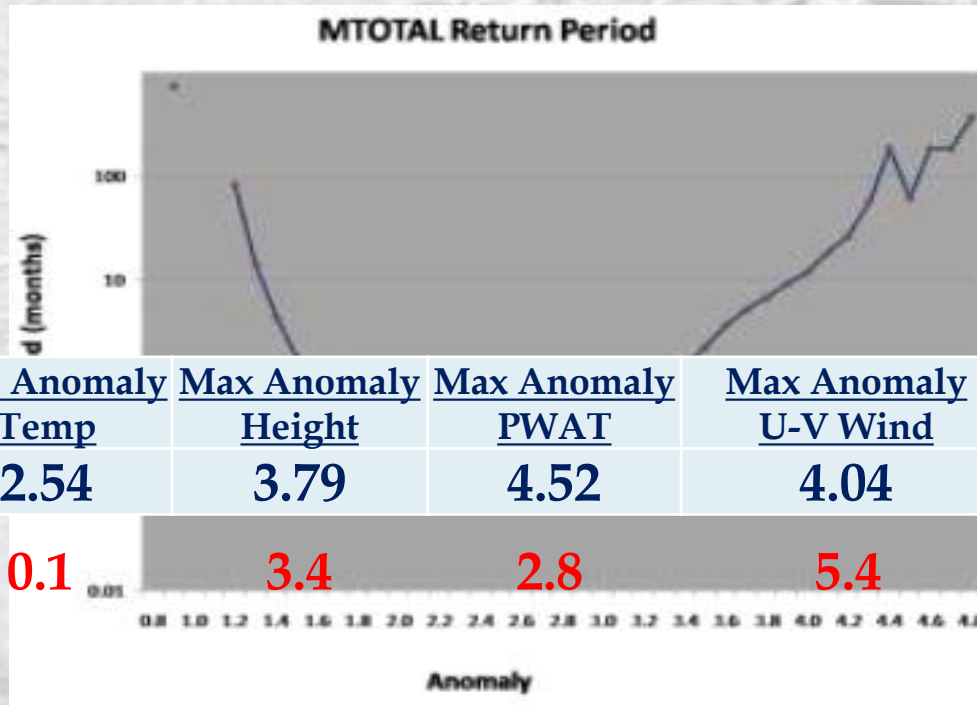

Rank	Date	M_{total}	Event Description
1.	January 11, 1975	4.65	Great Storm of 1975 (Blizzards midwest, tornadoes SE)
2.	October 13-14, 1997	4.60	South Texas/Coastal Bend Flood
3.	December 27-28, 1980	4.40	Deep coastal Florida low
4.	January 8, 1958	4.31	Record high temps in SD, MN; FL low
5.	May 27-28, 1973	4.24	Tornado outbreak from MI to AL. S. Appalachian floods
6.	January 9-10, 1953	4.23	Heavy Rain/T-Storms SE, FL tornadoes
7.	November 21, 2006	4.23	Deep SE low. Snow into central FL
8.	October 20, 1989	4.20	Lower Mississippi record cold/snow
9.	December 22, 1972	4.17	Deep Gulf system
10.	November 2, 1966	4.13	Appalachian snowstorm, lower Mississippi cold intrusion
⋮			
20.	October 16, 2006	4.04	Severe weather/flooding TX/MS

Tropical Storms excluded due to overwhelming the rankings.

Anomalies

<u>Time</u>	<u>Date</u>	<u>Max Anomaly Temperature</u>	<u>Max Anomaly Height</u>	<u>Max Anomaly PWAT</u>	<u>Max Anomaly U-V Wind</u>	<u>Mtotal</u>

Data from NCEP 75km GEFS & 32km SREF

<http://eyewall.met.psu.edu/rich/GFS>

Conclusion

- Although the overall anomalies demonstrated a frequent return interval the impacts were high.
 - Duration
 - Area not accustomed to these conditions
 - Christmas Holiday
- Keep anomalies in context
 - Anomalies could show a high return frequency, but could still be rare for a given location
 - Anomalies enhancing a specific signal or seasonal normal could be an indicator of a high impact event
 - ❖ Anomalously high moisture or upper wind fields during a severe weather forecast
 - ❖ Anomalously high temperatures for a heat wave forecast
 - Keep social impacts in mind when using anomalies
